

### NEURAL NETWORKS (AND XGBOOST)

Naumaan Nayyar

#### **COURSE**

### PRE-WORK

#### PRE-WORK REVIEW

- Understand Logistic Regression and link functions
- ▶ Be familiar with training and testing classifiers and regressors

#### **OPENING**

### ARTIFICIAL NEURAL NETWORKS

#### **OPENING**

- Neural networks were first studied in the 1940s (!) as a model of biological neural networks
- Many advances since then have improved the ability to train and apply neural networks
- Good for both classification and regression but difficult to interpret model behaviors
- Deep learning in the past few years has been highly successful for otherwise difficult problems

#### **OPENING**

- ▶ Today we will focus on types of neural networks and their applications, and skip some of the more technical details
- ➤ Specifically we'll skip training neural networks -- there are many methods in various situations and the details can be tedious (but not particularly difficult)
- ▶ Methods include backpropagation, gradient descent, and Hessian-free learning

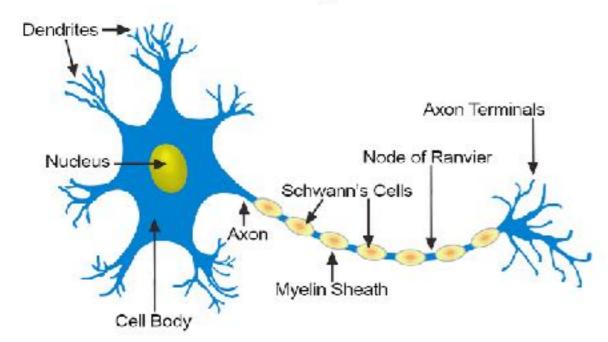

#### **INTRODUCTION**

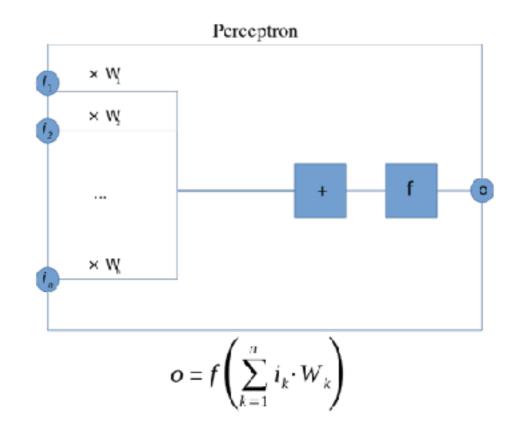

### PERCEPTRON

#### **PERCEPTRON**

- Perceptrons are the simplest example of a neural network
- ▶ The idea is to emulate a single <u>neuron</u>

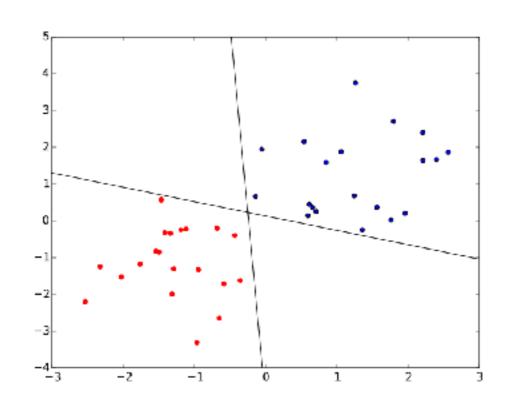

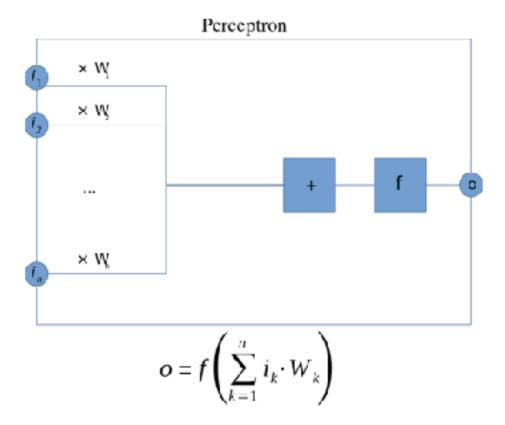

#### **PERCEPTRON**

- Perceptrons are the simplest example of a neural network
- Given n inputs and an <u>activation</u> or link function f
- ▶ The perceptron computes a linear separating curve

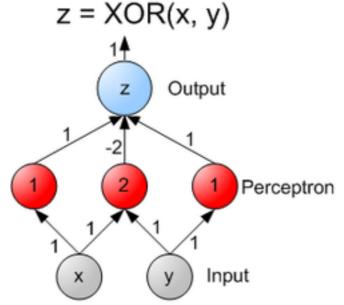

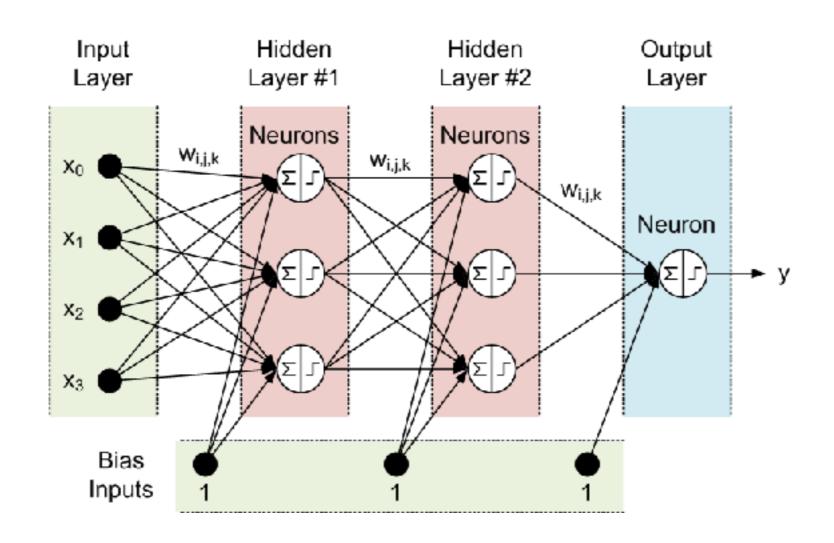

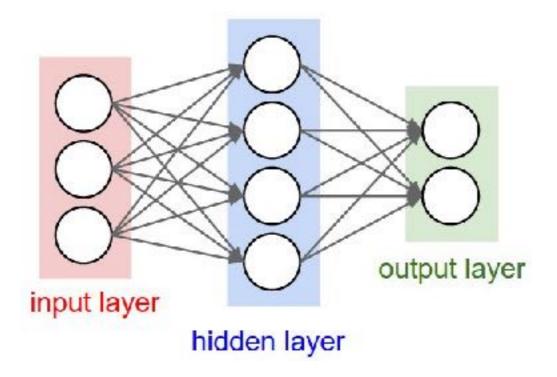

#### **PERCEPTRON**

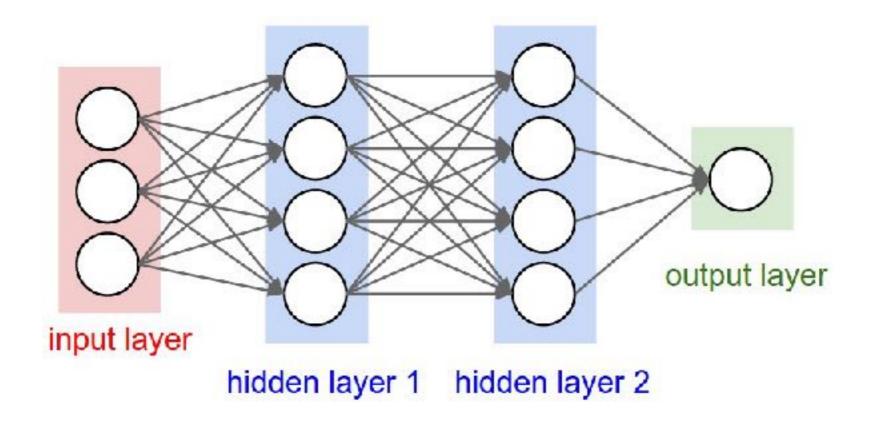

- ▶ Common <u>activation functions</u> are linear, logistic, tanh, and <u>softmax</u>
- ▶ We'll see shortly that some are better for classification, some for regression

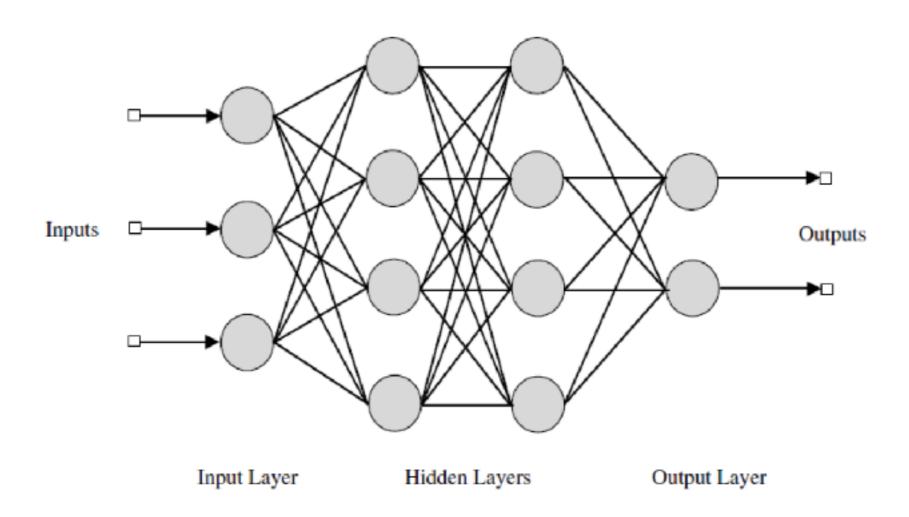

Perceptrons can be combined into multilayer perceptrons or feedforward network

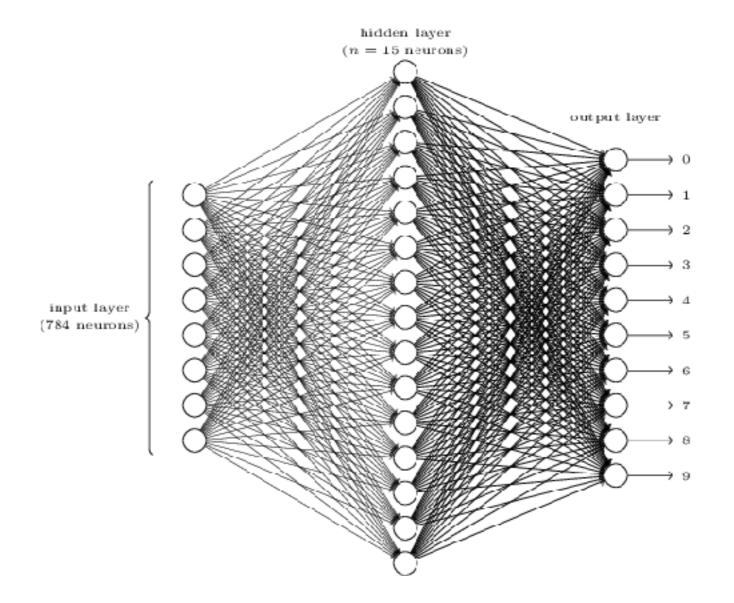

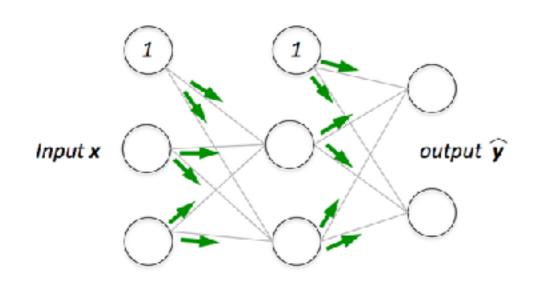

- ▶ Typically we use the following activation functions
  - ▶ Input layers have no activation. Simply inputs!
  - ▶ Linear layers for regression output
  - ▶ Logistic or Tanh for binary output
  - Softmax for n-class output (yields probabilities)

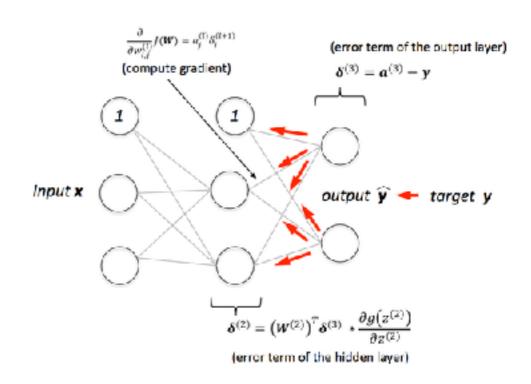

#### **GUIDED PRACTICE**

### TRAINING

#### **TRAINING**

- ▶ Feed forward neural networks can be trained with <u>backpropagation</u>
- Advanced reference that shows an example

#### **TRAINING**

- Key Parameters
  - Learning Rate (gradient descent for training)
  - ▶Epochs: number of backpropagation passes (over entire dataset)
  - Batch size: how many training points used at a time to update weights
- Model otherwise behaves as usual with
  - model.predict
  - >model.predict\_classes

#### **TRAINING**

- **▶** Tips
  - If the error jumps around per epoch, decrease the learning rate
  - ▶ Taking too long to train: use higher learning rate or batch\_size
  - ▶ High error after convergence?
    - ▶ More hidden layers / neurons
    - Normalize data or use PCA

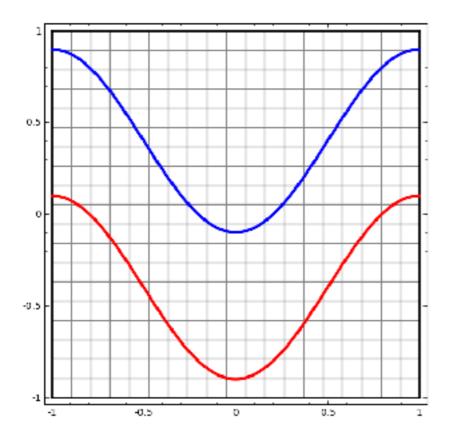

## UNIVERSAL APPROXIMATION THEORY

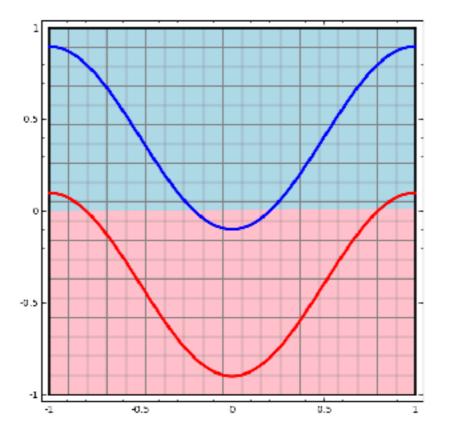

#### **UNIVERSAL APPROXIMATION**

- ▶ One major reason that neural networks are useful is the <u>Universal</u> <u>Approximation Theorem</u>
- The result basically says that many real vector-valued functions can be approximated arbitrarily well with *some* feed-forward neural network
- This is why neural networks are useful for regression -- given enough data and the right network structure they can fit many common data sets

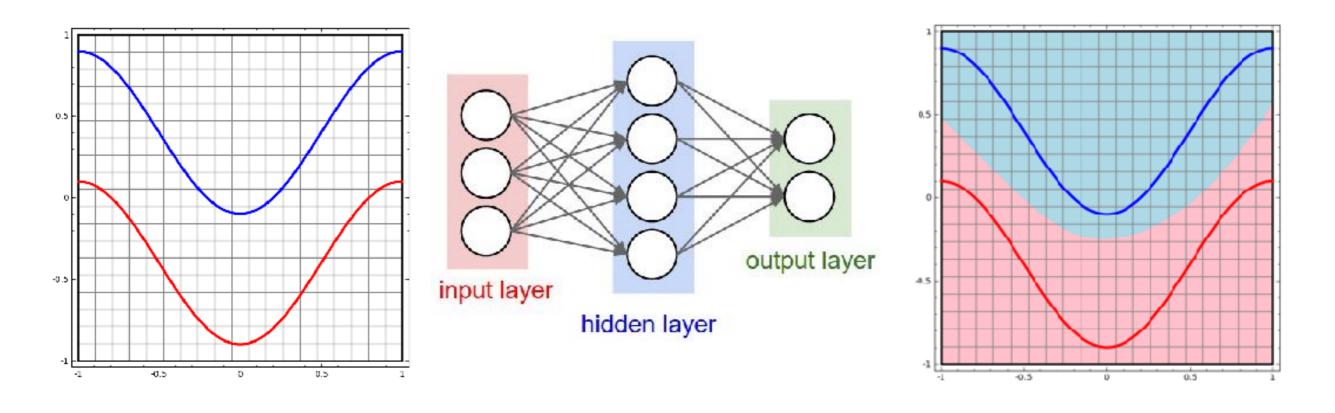

## CLASSIFICATION WITH NEURAL NETWORKS

- ▶ Neural Networks are also extremely useful for classification (<u>source</u>)
- ► No hidden layers:

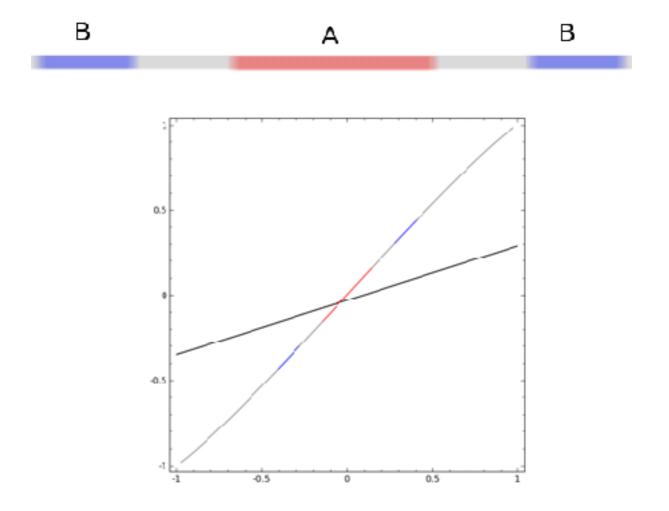

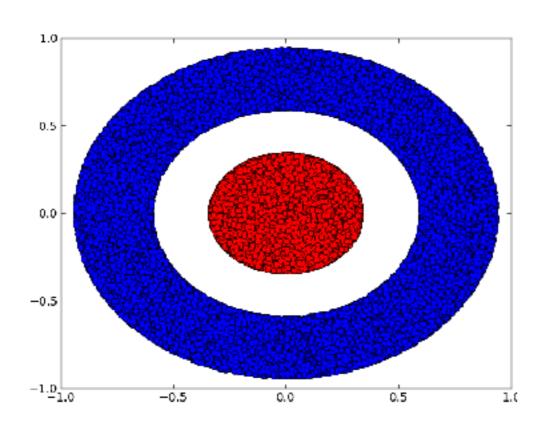

- ▶ Neural Networks are also extremely useful for classification (<u>source</u>)
- ▶ One hidden layer:

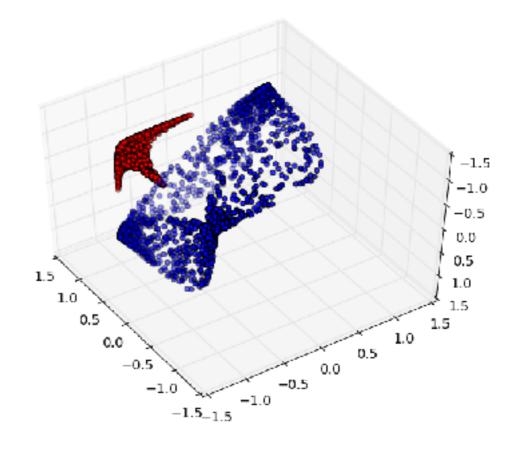

▶ Neural Networks are also extremely useful for classification (<u>source</u>)

Neural Networks are also extremely useful for classification (source)

- The neural network transforms the data topologically (no tears or breaks) and then separates the data with a hyperplane
- NNs are capable of handling difficult data sets, including:
  - Image processing: recognizing hand-written characters
  - ▶Image compression
  - Financial forecasting
  - ▶ Many others

#### **ACTIVITY: KNOWLEDGE CHECK**

#### **ANSWER THE FOLLOWING QUESTIONS**

- 1. Let's practice using <u>neural networks for classification</u>. For each of the four datasets, experiment with the number of layers and neurons to find the best model
- 2. Also take a look at this visualization

#### **DELIVERABLE**

Answers to the above questions

# NEURAL NETWORKS IN PYTHON

#### NN IN PYTHON

- There are many NN libraries for python and other languages
- **Python** 
  - ▶ Theano
  - **▶**Keras
  - ▶ Lasagne
  - **→**TensorFlow
  - Scikit Learn support for NN coming in 0.18
- Lua
  - Torch
- Some of these libraries utilize GPUs for (much) faster training

#### NN IN PYTHON

- Let's look at some examples in Keras
  - **▶**Regression
  - **▶**Classification

## DESIGNING NEURAL NETWORKS

#### NN IN PYTHON

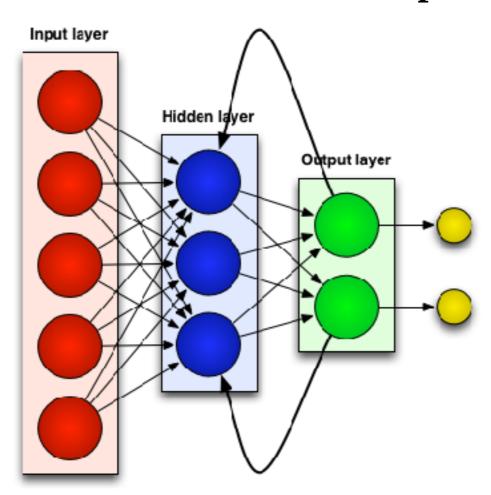

- Network design is a hard problem
  - **▶**Experience helps
  - ▶ Evolutionary algorithms are <u>useful</u> for <u>design</u>
  - Nice (free) book available
- **▶**Tips
  - Number of input layer nodes = number of features (obviously!)
  - Number of output layers nodes
    - ▶1 if regression
    - ▶1 if binary classification
    - N (number of classes) if softmax is used as activation for multi-label classification
  - Number of hidden layers
    - If data is linearly separable, no hidden layer needed
    - If not, one suffices in a lot of cases. More make the number of parameters exponentially fewer, but are more difficult to train
    - For more details, look at <a href="http://www.faqs.org/faqs/ai-faq/neural-nets/part1/preamble.html">http://www.faqs.org/faqs/ai-faq/neural-nets/part1/preamble.html</a>
  - Number of neurons
    - ▶Between input and output nodes, e.g. mean
- ▶Additional info: <a href="https://stats.stackexchange.com/questions/181/how-to-choose-the-number-of-hidden-layers-and-nodes-in-a-feedforward-neural-netw">https://stats.stackexchange.com/questions/181/how-to-choose-the-number-of-hidden-layers-and-nodes-in-a-feedforward-neural-netw</a>
- ▶ Even more additional (and very detailed) info: <a href="http://lamda.nju.edu.cn/weixs/project/CNNTricks/CNNTricks.html">http://lamda.nju.edu.cn/weixs/project/CNNTricks/CNNTricks.html</a>

#### **NN IN GENERAL**

- Detailed information about various aspects of Neural Networks: <a href="http://lamda.nju.edu.cn/weixs/project/CNNTricks/CNNTricks.html">http://lamda.nju.edu.cn/weixs/project/CNNTricks/CNNTricks.html</a>
- The most comprehensive book yet on Deep Learning
- Another great online book on Neural Networks and Deep Learning

# RECURRENT NEURAL NETWORKS

▶ Recurrent Neural Networks contain loops (<u>source</u>)

- Recurrent Neural Networks contain loops
- ▶ This implements feedback and gives neural networks "memory" or context
- Particularly good for predicting sequences, translating text, recognizing objects in images, speech translation
- ▶ Commonly referred to as deep learning, involving both feature extraction and modeling
- Nice intro here

► RNN font analysis

**▶** <u>Automatic Colorization</u> with CNN

- ► RNN font analysis
- Automatic Colorization with CNN
- ▶ Automatic translation
- **▶** Deep Learning Applications

### **CONCLUSION**

# TOPIC REVIEW

### **CONCLUSION: Neural Networks**

### Pros:

- Flexible
- Good for a variety of tasks
- Good for many types of data

### Cons:

- Can require a lot of data
- Training may be slow
- Many parameters to tune
- Many layer types and activations
- Black Box model

### **CONCLUSION**

- ▶ Many more examples for Keras available
- ▶ Recommended articles: Convolutional NN,
- Advanced machine learning methods you should explore include Bayesian methods and deep learning

## BOOSTING AND XGBOOST

### **BOOSTING**

- ▶ Boosting: combining multiple 'weak learners' to get a 'strong learner'
- ▶ Weak learners: Model only slightly correlated with true model, but better than random
- ▶ Strong learners: Model can get arbitrarily close to true model
- ▶ Why weak learners? They are simple. E.g. a one-level decision tree
- ▶ Protip: Boosting reduces bias error!

### **BOOSTING: HOW IS IT DIFFERENT FROM BAGGING**

- ▶ Bagging and boosting represent different ways of combining models to reduce error
- ▶ Bagging (Boostrap AGGregatING) combines multiple learning algorithms (which are not weak) in parallel. e.g. Random Forests, Extra Trees.
  - ▶ Input: Low bias, high variance
  - Output: Low bias (slightly higher than individual), low variance
- ▶ Boosting combines multiple weak learning algorithms iteratively. e.g. XGBoost, AdaBoost
  - ▶ Input: High bias, low variance
  - Output: Low bias, low variance

### **BOOSTING**

- ► First such algorithm: <u>AdaBoost</u>
- ▶ AdaBoost is a generalized methodology
- It can be applied to many different learning models
- ► Another such algorithm: XGBoost
- ▶ XGBoost applies boosting to decision trees

### **ACTIVITY: KNOWLEDGE CHECK**

#### **ANSWER THE FOLLOWING QUESTIONS**

1. Let's practice using boosting with XGBoost. Install XGBoost with the following command:

conda install -c aterrel xgboost=0.4.0

- 2. Work through <a href="http://machinelearningmastery.com/develop-first-xgboost-model-python-scikit-learn/">http://machinelearningmastery.com/develop-first-xgboost-model-python-scikit-learn/</a>
- 3. How is boosting different from bagging?

#### **DELIVERABLE**

Answers to the above questions

### **BOOSTING**
